

## Tutorial 4 exercise

Given a base class Pet.

| Pet                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -name: String<br>-breed:String<br>-weight:double                                                                                                                        |
| +Pet(name: String, breed:String, weight:double)<br>+name(name:String)<br>+name():name<br>+weight():double<br>+display()<br>+toString()<br>+sound()<br>+eat(food:String) |

And two child class Dog and Cat that extends Pet

| Dog                                                                                                         |
|-------------------------------------------------------------------------------------------------------------|
| -microchipped:boolean                                                                                       |
| +Dog (name: String, breed:String, weight:double, microchipped:boolean)<br>+sound()<br>+eat()<br>+toString() |

| Cat      |
|----------|
|          |
| +sound() |

- Implement the above three classes.
  - Sound => Pet has no sound, Cat meow and Dog bark.
  - Eat => Pet and Cat eat whatever is feed, Dog eat only cookies
- Create a few Cat and Dog objects and put into an ArrayList.
- Sound and feed the five pets in the list using a for loop
- Create a csv file as follow

```
Dog,Snoppy,Beagle,23,true  
Dog,Scooby Doo,Great Dane,70,false  
Dog,Goofy,Canine,50,true  
Cat,Garfield,Orange Tabby,27  
Cat,Hello Kitty,Japan,5
```

Read in csv file and create the Pet object using the information in the csv file.
